

**School of Computer Science and Artificial Intelligence****Lab Assignment # 10.2**

---

<b>Program</b>	: B. Tech (CSE)
<b>Specialization</b>	: -
<b>Course Title</b>	: AI Assisted Coding
<b>Course Code</b>	: 23CS002PC304
<b>Semester</b>	: II
<b>Academic Session</b>	: 2025-2026
<b>Name of Student</b>	: Vemula Rikith
<b>Enrollment No.</b>	: 2403A51L35
<b>Batch No.</b>	: 52
<b>Date</b>	: 10/02/26

---

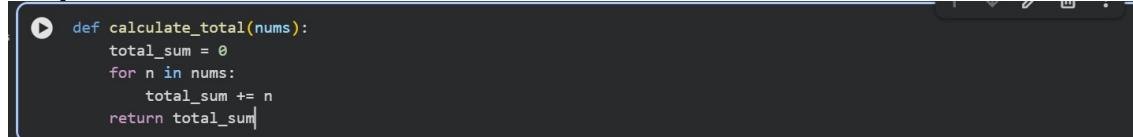

**Submission Starts here****Screenshots:****Task Description -1(Error Detection and Correction)****Code used:**

```
def calculate_total(nums)
    sum = 0
    for n in nums
        sum += n
    return total

...
File "/tmp/ipython-input-1993060875.py", line 1
    def calculate_total(nums)
                           ^
SyntaxError: expected ':'
```

A screenshot of a Python code editor window. It shows a function definition named 'calculate\_total' that takes a parameter 'nums'. Inside the function, there is a loop that iterates over 'nums' and adds each value to a variable 'sum'. After the loop, the function returns 'total'. Below the function definition, there is an ellipsis '...', followed by the file path '/tmp/ipython-input-1993060875.py' and line 1. A syntax error is indicated at the end of the line with a red vertical bar under the closing parenthesis of the function definition, and a message 'SyntaxError: expected ':'' is displayed.**Prompt:**

Correct the code and give brief explanations of the identified syntax and logic errors.

**Output:**

```
def calculate_total(nums):
    total_sum = 0
    for n in nums:
        total_sum += n
    return total_sum
```

A screenshot of a Python code editor window showing the corrected code. The function 'calculate\_total' now uses a variable name 'total\_sum' instead of 'total' to avoid shadowing the built-in 'sum' function. The rest of the code remains the same as the original input.**Explanation:**

- 1) Missing colons: Python requires a colon : at the end of def (function definition) and for (loop definition) statements.
- 2) Variable shadowing: I renamed the sum variable to total\_sum to avoid overwriting Python's built-in sum() function, which can lead to unexpected behavior.
- 3) Undefined variable: The function was trying to return total, but the variable was named sum (or total\_sum after the fix). I've corrected it to return total\_sum.

## Task Description -2(Code Style Standardization)

Code Used:

```
▶ def findSum(a,b):return a+b
  print(findSum(5,10))
...
... 15
```

Prompt:

convert the code to follow standard style conventions.

Output:

```
▶ def find_sum(a, b):
    return a + b

  print(find_sum(5, 10))
...
... 15
```

## Task Description -3(Code Clarity Improvement)

Code used:

```
▶ def f(x,y):
    return x-y*2
  print(f(10,3))
...
... File "/tmp/ipython-input-2982719317.py", line 2
    return x-y*2
      ^
IndentationError: expected an indented block after function definition on line 1
```

Prompt:

rewrite the code with meaningful function and variable names, proper indentation, and improved clarity.

Output:

```
▶ def calculate_value(first_number, second_number):
    """Calculates the first number minus two times the second number."""
    result = first_number - (second_number * 2)
    return result

# Example usage with meaningful variable names for the call
input_a = 10
input_b = 3
output = calculate_value(input_a, input_b)
print(output)
...
... 4
```

## Task Description -4(Structural Refactoring)

Code used:

```
▶ print("Hello Ram")
  print("Hello Sita")
  print(["Hello Ravi"])

...
Hello Ram
Hello Sita
Hello Ravi
```

Prompt:

make the code modular using reusable functions to eliminate repetition.

Output:

```
◆ Gemini
▶ def greet_person(name):
    print(f'Hello {name}')

greet_person("Ram")
greet_person("Sita")
greet_person("Ravi")

...
Hello Ram
Hello Sita
Hello Ravi
```

## Task Description -5(Efficiency Enhancement)

Code used:

```
▶ numbers = []
for i in range(1, 500000):
    numbers.append(i * i)
print(len(numbers))

...
499999
```

Prompt:

Optimize the code to achieve the same result with improved performance.

Output:

```
◆ Gemini
▶ numbers = [i * i for i in range(1, 500000)]
print(len(numbers))

...
499999
```
